

Geospatial Integration with SAP

Snohomish County PUD

Tim Epp

David Barclay

About Snohomish PUD

- **Second largest publicly owned utility in Washington**
- **337,000 electric customers and 20,000 water customers**
- **Service territory covers over 2,200 square miles of Snohomish County and Camano Island**
- **Operate 3 Hydroelectric Plants**
- **6,000+ Miles of Wire**
- **93,500 Transformers**
- **113,000 Poles**
- **370,000 Meters**
- **and thousands of other misc equipment**

SAP Implementation

- Replacement of legacy ERP
- Consolidation of other Asset Registry and Asset Management systems

Design Goal

- ▶ Make information about field equipment available in both GIS and SAP
 - ▶ Presents information to users in the context in which they are working
 - ▶ Makes more information available for standard reporting in each system
 - ▶ Minimizes disruption of work processes to groups which maintain information
- ▶ Use GIS for what it does best:
 - ▶ Connectivity information
 - ▶ Geographic display
- ▶ Use SAP for what it does best:
 - ▶ Asset Lifecycle Management
 - ▶ Cost analysis

So why not choose one source?

- ▶ For any serialized equipment, we track from the moment received (SAP)
- ▶ All other equipment doesn't get tracked until designed/installed (GIS)
- ▶ In some cases, the decision was also based on division of responsibilities for information

- ▶ But there's still overlap, things we want to see in both places:
 - ▶ Equipment attributes/characteristics
 - ▶ Recent activities (e.g. last inspection date)

Challenges

- Keeping the two systems in sync with minimal effort and no errors
- Yet another numbering system
- Concept of SAP Functional Location (FLOC) doesn't exist explicitly in GIS
 - Think of it as a place on the earth where a certain function is performed
 - It's the location where equipment gets "installed"
 - In SAP it can be established in a hierarchical arrangement
- Must have clear system of record (owner) for each piece of information
 - Don't want the same data going back and forth
 - Don't want to create equipment in GIS that SAP doesn't already know about
 - Eliminate risk of mistyped information, i.e. no fat fingering of key fields

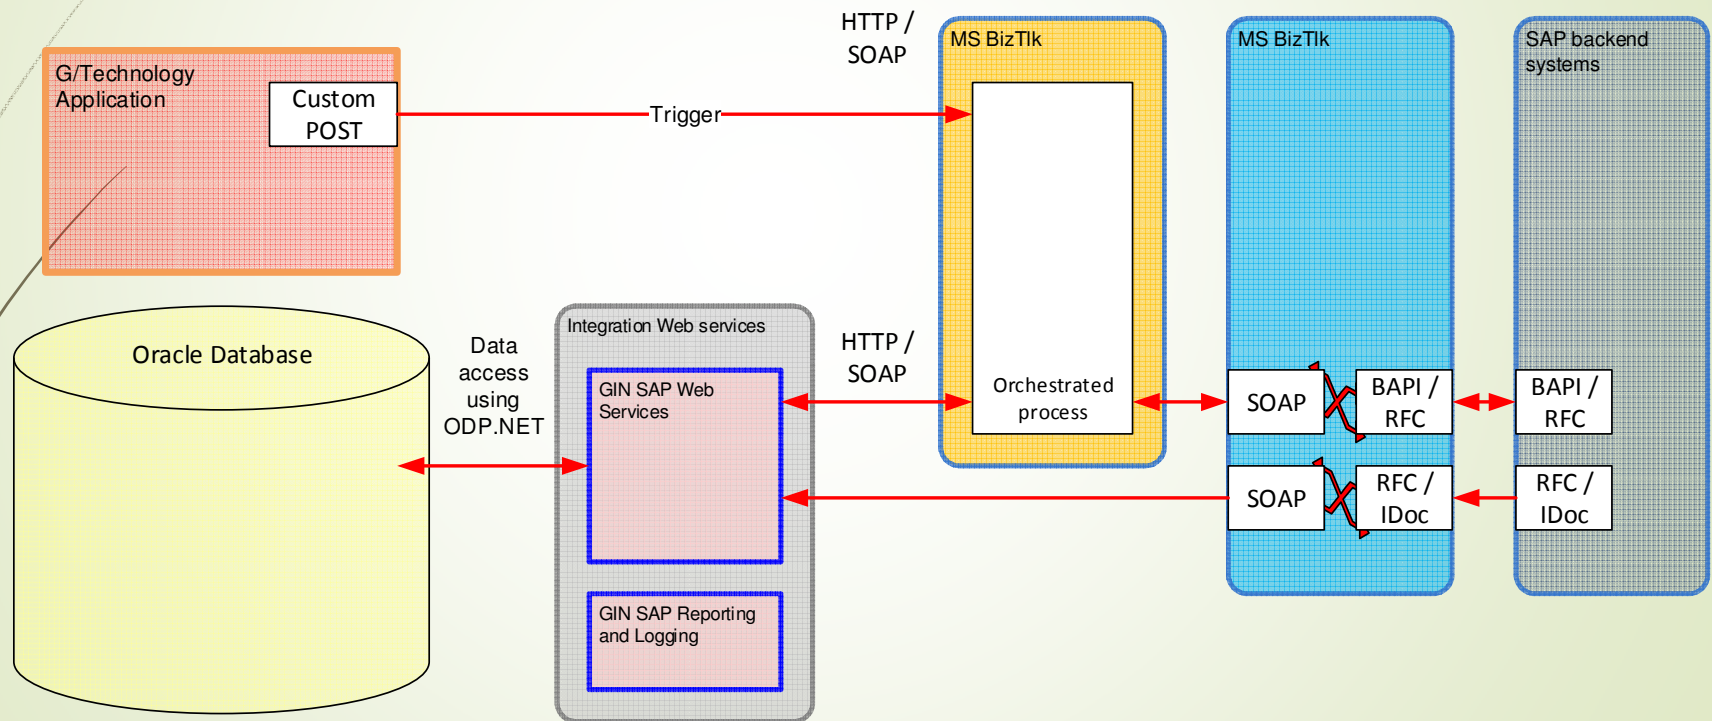

Method

- Off the Shelf Interface (Intergraph SAP Interface)
 - Previous Experience with weekly Sync Interface (Meters)
- Proven Technology
 - 21+ other utilities using interface
- Web Service based making use of ESB (BizTalk, PI)
 - BizTalk sends SOAP Message to SAP PI
 - PI sends BAPI calls to SAP
- Table Driven
- Bi-Directional
- Synchronous

System Diagram

SAP to GIS landscape

Examples

- ▶ Background Pole Scenario
 - ▶ New Pole with Joint Use Attachments
- ▶ Move to new FLOC/Superior FLOC
 - ▶ Update from GIS / Dismantle and Install in SAP
- ▶ Transformer Scenario
 - ▶ Refurbishment
- ▶ Replace Equipment Scenario
 - ▶ Reproduce a Dismantle and Install

just
another
example

Key Project Decision: Water

- Water system information tracked in a separate GIS
- Want to make use of the same integration architecture between SAP and GIS
- Existing goal: consolidate into single GIS platform
- Decided to consolidate during the project

Data Quality Checks

- ▶ Report to compare GIS and SAP
 - ▶ Installed Equipment (GIS) vs. Installed Equipment (SAP)
 - ▶ Available Equipment (GIS) vs. Available Equipment (SAP)

Links from GIS to corresponding SAP records

Programmatically build Hyperlinks in GIS to SAP Equipment Record and OpenText

The screenshot shows a GIS application interface. The top portion is a map with red annotations, including circles and lines, and labels such as "18-18-18/02", "1784", "205889", and "132". Below the map is a data table with a tabbed interface. The tabs include "Review Pole", "Review SAP Data", "Review Pole Attachment", "Review Facility Location", "Review Pole Inspection", "Review Notes", "Review Miscellaneous", and "Review Hyperlink". The "Review Hyperlink" tab is active, displaying a table with the following data:

Lessons Learned

- ▶ Scope, schedule and resources will drive quality
 - ▶ We would have had better quality had we been able to adjust at least one of these other
- ▶ In spite of best design, still want to have reconciliation reports to ensure that data is being kept in sync and identify potential process issues
- ▶ The field has benefited by keeping accurate information available in a geographic view that matches the work assignments (referencing the equipment) they are seeing on their iPads

Future Work & Opportunities

- ▶ Still working through defects
 - ▶ It's difficult to think of all work scenarios to test during the course of a project
- ▶ Evaluating use of batch in some scenarios where that method makes more sense
 - ▶ Bulk load
 - ▶ Information not required immediately
 - ▶ Less complicated
- ▶ Stop storing certain information in 2 systems and just make web service calls to display the info that is stored in the other context
- ▶ Extend the ability to navigate back and forth between the 2 systems
